AI Job Hunt Tracker
Career Analysis Report

AI-assisted analysis of an illustrative job application dataset

This report summarizes the job-search data provided to the AI career analyst, highlights patterns in the sample, and presents practical recommendations.

1. Overall job search performance

10 Total applications	**4** Interview + Offer
30% Interview status rate	**10%** Offer rate

The dataset shows 5 applications still in Applied status, 3 in Interview, 1 Rejected, and 1 Offer.

Note: These are descriptive rates from a small illustrative dataset, not a prediction of future results.

2. Important observations

Observation 1: Data Analyst is the main target role

6 out of 10 applications are for Data Analyst positions.

Observation 2: LinkedIn is the most-used portal

Job portal	Applications
LinkedIn	4
Naukri	3
Company Website	2
Indeed	1

Observation 3: One offer is recorded

There is one Offer in the sample. This is a positive outcome, but more applications are needed before drawing strong conclusions.

3. Job portal recommendations

- **LinkedIn:** Continue using it and explore recruiter connections.
- **Naukri:** Keep your profile updated and use relevant keywords.
- **Company Websites:** Apply directly when your skills match the job description.
- **Indeed:** Test it with more applications before judging its effectiveness.

Important: We cannot say LinkedIn performs best just because it has the most applications. Portal-wise interview and offer conversion rates are needed to compare performance fairly.

4. How to improve interview conversion

1. Customize your resume for each job description.
2. Highlight SQL, Python, Excel and Power BI projects.
3. Practice SQL joins, aggregations and business case questions.
4. Prepare clear explanations of your projects.
5. Follow up professionally after applying or interviewing.

5. Three actionable next steps

6. **Improve your resume**
   Create separate resume versions for Data Analyst and Business Data Analyst roles.
7. **Track application performance**
   Record portal, application date, interview status, follow-up date and final result.
8. **Build your portfolio**
   Complete this Job Hunt Tracker project and publish your Power BI dashboard and Python analysis on GitHub.

6. Phase 5 — What we learned

The exercise practised the following AI-assisted analytics workflow:

Python Data → Summary → AI Prompt → Career Insights → Recommendations

Important distinction: In this exercise, the generated prompt was manually provided to ChatGPT. This is AI-assisted analysis, not yet an automated AI integration through an API.
